Let's Start!

Combining users and technology to understand data.

Learning Outcome:

Understand information about relational database management system in spoken or written texts.

Ask your partner:

- How important do you think it is for companies to train their staff in using the latest technology?
- In your opinion, what is the difference between data and database?

Can Do Statements:

- I can explain the data resources in information systems.
- I can give examples of data resources in information systems.
- I can analyze information related to data resources in information systems.

Let's Explore!

Data in information systems

Instructions: Read the text below.

For today's meeting, we are supposed to discuss several aspects to understand data. First of all, an information system refers to the combination of users, technology, and processes to complete a specific goal. These users are supposed to utilize hardware and software, typically in a network format, to process raw data into usable information. Therefore, if companies get the latest technology without paying attention to staff training, goals will be difficult to achieve. Users, technology and processes are supposed to work together to get a specific goal.

Secondly, Data Resource is a component of information system infrastructure that represents all the data available to an organization. If organizations are automated or non-automated, they will have different needs. The data resource is a separate component of this infrastructure. However, a digital data resource is supposed to provide faster and more efficient options for managing data for companies. Data is the raw material or information with no context; for example, if you have software, you will need data to do anything useful.

Some other examples of data are: MP3, video files, spreadsheets, web pages, and e-books. If you look for types of data, you will identify text, number, alphanumeric text, and objects such as images or music files. If you work in the IT sector, you will have to differentiate databases from data. Whereas data belongs to a database, databases are more powerful ways to define the types of data that go into each field, reducing possible errors and allowing easier analysis.

Finally, as a member of the IT department, you need to analyze information about data resources; for example, we are supposed to explain that data resources of information systems are typically organized into databases and knowledge bases. For now, I will write a short summary with key points if you help me with the training.

Let's Practice!

Technology

Instructions: Match column A with Column B.

COLUMN A

1. The pieces of data are supposed to
2. In order to process data, we are supposed to
3. Stakeholders are supposed to
4. Information systems are supposed to
5. Data by itself is not supposed to

COLUMN B

- a. ____ be usable information.
- b. ____ be processed into information.
- c. ____ use hardware and software.
- d. ____ work towards a specific goal.
- e. ____ take part in the process of data consolidation.

Let's Practice!

The importance of data information systems

Instructions: Circle the correct option.

1. If you (will compile / compile) the data, it will be easier to have access to it.
2. I (will buy / buy) new hardware if you need it.
3. If you have good software, you (extract / will extract) data faster.
4. We won't share the information if we (don't have / won't have) a reliable network.
5. If you don't have a data record, you (aren't / won't be) able to handle the data.

Extension Activity

Data Information systems

Instructions: Complete the following steps. Fill in the Self-Assessment.

- Research on data types, and information systems.
- Choose any business you like, and decide the type of data to be gathered for that company.
- Decide on a software program to record and handle the data, and justify it

Self-Assessment

Yes

No

- I talk about data sources.
- I differentiate types of data.
- I choose software programs to handle data.

☐	☐
☐	☐
☐	☐

Target Words

- **infrastructure** (noun): the basic systems and services, such as transport and power supplies, that an organization uses in order to work effectively
e.g. The data resource is a separate component of this infrastructure.
- **differentiate** (verb): to show or find the difference between things
e.g. You will have to differentiate databases from data.
- **spreadsheet** (noun): a computer program, used especially in business, that allows you to do financial calculations and plans
e.g. Some other examples of data are MP3, video files, spreadsheets, web pages, and e-books
- **summary** (noun): a short description that provides the main facts or ideas about something
e.g. I will write a short summary with key points if you help me with the training.
- **belong** (verb): to have the appropriate qualifications to be part of a group
e.g. Whereas data belongs to a database.
- **allow** (verb): to give someone or something permission to do something
e.g. Databases are more powerful ways to define the types of data that go into each field, reducing possible errors and allowing easier analysis.

Learning Points

Be supposed to in affirmative statements

"**Be supposed to**" is used to show expectation in the past, the present, or the future.

Be supposed to means something is planned, arranged, or expected.

It is important to consider what tense you want to use in order to coherently use the corresponding form of the verb to **be** preceding the words **supposed to**. Remember that this verb phrase always uses a principal verb in the infinitive form after **supposed to**.

Take a look at the following examples.

If someone, for example, says you **are supposed to do something**, that person is trying to say that you are expected to do something in the present.

If someone, on the other hand, says that something **was supposed to** happen, that person is trying to say that something was expected to happen but never did.

Examples:

We are supposed to find a good job in the IT sector.

She was supposed to contact the managers beforehand.

Technology is supposed to facilitate people's lives. .

Examples

- *For today's meeting, we are supposed to discuss several aspects to understand data.*
- *We are supposed to explain that data resources of information systems are typically organized into databases and knowledge bases.*

Learning Points

Conditional sentences with if clauses, first conditional

The first conditional is used to talk about situations that might happen in the future; it describes consequences which may easily come true.

Structure:

The first conditional is composed of a condition and a result.

Condition	Result
If + Present tense + ,	will / can / may / must + verb
If you are an IT expert,	you will have many job opportunities.

You can change the position of the clauses. Thus, your sentence can start with the clause containing the result and, then, be followed by the one explaining the condition.

Result	If condition
will + base verb	present Simple
I will stay in my current job	if my boss offers me a raise.

Examples

- *If you work in the IT sector, you will have to differentiate databases from data.*
- *I will write a short summary with key points if you help me with the training.*
